

GSPS Product Requirements Document

Consolidated PRD | Product, engineering, risk, and data requirements | August 2026

Purpose

This product requirements document consolidates the existing GSPS specification, branding rules, repository architecture, and the founder's creation doctrine. It is a build standard for an approachable, risk-aware market-planning platform—not a promise of investment performance.

Product statement

GSPS helps traders turn market movement into clear, risk-defined trade scenarios. It should present conditions, explain the next action, preserve user control, and retain the evidence needed to review outcomes.

Success standard

A scan must answer five questions without ambiguity: What is the current reference price? Which timeframe governs the setup? What structural context matters? How long is the setup valid? What should the user do next?

User and product scope

Area	Requirement
Core user	Novice and developing retail traders who need a calm, structured planning workflow before taking a position.
Primary product	GSPS — Guided Stock Projection System. Evolve to Guided Stock Projection Suite when multiple integrated products are mature.
Primary workflow	Choose market/symbols → scan → review Trade Map → wait, paper trade, plan, or route a user-authorized order through supported broker flows.
Asset progression	Begin with equities and constrained paper/planning workflows; gate options and other leveraged products behind suitability, permissions, and risk controls.
Public promise	Planning and educational support; no guarantees, predictions, or instructions to buy/sell.

Functional requirements

Scanning and reference price

- Use the newest executable price available at scan time. When extended-hours data is supported and materially changes the reference price, recompute levels and disclose that levels were adjusted.
- Preserve the scan timestamp, session context, asset, timeframe, data-source reference, and freshness status.
- Support multi-timeframe analysis: higher timeframe establishes context; lower timeframe may refine execution only when confirmed.

Structure and conflict resolution

- Represent support, resistance, and flip areas as zones with tolerance bands, reaction history, touch counts, and a quality state such as fresh, established, weakening, or failed.
- Resolve conflicting signals deterministically: higher-timeframe bias, structural context, execution-pattern state, proprietary setup alignment, momentum, trigger confirmation, then risk/invalidation.

- Return an explicit state: Qualified Long, Qualified Short, Watch, Conflict/Wait, or Stand Down. A score alone is never an instruction.

Trade Map output

- Show Market Outlook, Setup Status, Entry Zone, First Target, Final Target, Risk Level, Pivot Plan, Setup Strength, timeframe, generated time, and plain-language notes.
- Include a counter-scenario: what to watch if the original outlook fails.
- Use conditional language: wait for confirmation, consider, reassess, and do not force the setup.

Risk and execution

- Require a defined invalidation/risk level before an actionable plan. Apply user risk, deployed-capital, and per-trade budget limits before recommendation or simulated execution.
- Support paper trading and staged execution. Users can review and customize orders before any broker submission.
- Track pending, filled, closed, and manually exited positions separately.

Learning and records

- Maintain signal-to-action-to-outcome lineage, including scan context, plan, order/fill data, exit reason, realized result, fees, and review notes.
- Provide portfolio, closed trade, periodic tax-oriented summaries, CSV/export capability, and performance views.
- Backtests and replays must state model version, market-data window, assumptions, and outcome metrics.

Required entities and contracts

The canonical decision record must separate raw market context from derived analysis, user-facing trade plan, execution, and outcome. Every material decision should be reconstructible.

Entity	Minimum fields
Signal context	asset, scan time, session, source/freshness, timeframe, model version, analysis inputs and evidence references
Structure zone	type, center, tolerance, touch history, last reaction, quality, notes
Trade Map	outlook, status, entry zone, targets, risk level, pivot plan, setup strength, next action
Order / trade	user, broker account, asset, side, quantity, timestamps, fill price, fees, linked signal, exit reason, realized P/L
Learning record	model/version, replay/backtest provenance, outcome labels, critique/journal, approval and rollout metadata

Non-functional requirements

- Proprietary calculation mechanics remain server-side and behind neutral GSPS interfaces. Only required user-facing outputs are exposed.
- All public interfaces use approved GSPS terms: Market Outlook, Entry Zone, First Target, Final Target, Risk Level, Pivot Plan, and Setup Strength.
- Every customer-facing planning surface includes the educational/informational disclaimer and avoids performance guarantees.
- Changes to scoring, parameters, or recommendation logic are versioned, tested, reviewed, and reversible.
- Sensitive data uses least-privilege access controls, environment-managed secrets, authenticated server routes, migration discipline, and production monitoring.

Acceptance criteria

- A scan can return Stand Down or Wait with an explanation; it must not force a directional plan.
- An actionable Trade Map cannot be generated without a risk level, data freshness state, timeframe, and pivot condition.
- A user can inspect why a plan was produced without seeing proprietary intermediate formulas.
- A trade or paper trade can be traced back to the originating decision record and model version.
- The same rule path is used consistently in live scanning and replay/backtest evaluation where applicable.

Disclosure

GSPS provides market-analysis and trade-planning tools for educational and informational purposes only. It is not financial advice, investment advice, or a recommendation to buy or sell any security. Trading involves risk, including possible loss of principal. Past performance and projected levels do not guarantee future results.
