

GSPS Strategic Blueprint

Engineering sequence, operating model, and acquisition-readiness plan | August 2026

Executive directive

This blueprint converts the PRD and the Foundational Doctrine into a staged engineering and business plan. It prioritizes durable evidence, safe user workflows, and acquisition-grade operational discipline over feature volume.

Current platform baseline

GSPS is a modular Next.js application with app/API routes and dedicated domains for analysis, scanning, scoring, Gann-related logic, backtesting, brokers, guided decisions, journals, learning, notifications, onboarding, portfolios, and Supabase integration. The migration history includes trade logging, learning data, protocol exit plans, paper trading, Guided Decision Mode, security hardening, analytics, notifications, portfolio analytics, demo flows, referrals, and trade critiques.

Architecture target

Layer	Responsibilities	Must preserve
Intelligence	Market data, multi-timeframe analysis, structure zones, proprietary calculations, scoring, scenario generation.	Private server-side logic; typed outputs; source/time/version provenance.
Decision	Trade Map, guided sizing, risk caps, stand-down states, user workflow, staged/paper execution.	User control; plain language; no action without risk bounds.
Learning and proof	Replay/backtest, trade logs, outcomes, journals, critiques, portfolio analytics, model registry.	Append-only lineage where appropriate; reproducible methodology; evidence before adaptation.
Platform and trust	Auth, RLS, secrets, rate limits, migrations, monitoring, CI, deployment, documentation.	Least privilege, change control, backups, release/rollback records.

Build sequence

Phase	Deliverables	Exit criteria
0. Stabilize	Restore/query production data environment; reconcile deployment aliases; establish environment inventory and migration ledger.	Known production status, canonical migration order, owners, access boundaries, and operational runbook.
1. Decision record	Versioned signal/Trade Map contract; provenance fields; data freshness; scenario and pivot fields; model version.	Any displayed plan is traceable to context, version, evidence, and outcome path.
2. Evidence foundation	Replay methodology, audit trail, paper/outcome capture, model/version registry, reporting dashboards.	A rule change can be compared against prior versions using documented datasets and metrics.
3. Guided safety	Complete no-trade states, budget/risk/deployment caps, suitability gates, confirmations, and educational explanations.	A novice can understand why the system recommends wait, plan, or reduce exposure.
4. Scale and resilience	Market-data queue/cache, job isolation, rate-limit controls, provider abstraction, monitored automation.	Historical jobs and user scans do not compete destructively; degraded-provider behavior is explicit.
5. Suite expansion	Education, alerts, workbooks, analytics, APIs, integrations, and controlled automation permissions.	Each module reuses the canonical decision record and doctrine rather than creating parallel logic.

Priority workstreams

- Model versioning: freeze and identify scoring/parameter versions; never mutate a deployed version in place.
- Audit trail before adaptive learning: build outcome-ready records before changing weights from live behavior.
- Request queue and caching: separate real-time scanning from historical workloads and centralize rate limiting.
- Continuous IP/terminology checks: prevent internal methodology names or calculation clues from reaching public copy, APIs, reports, comments, or client bundles.
- Suitability and permissions: gate higher-risk assets, trading routes, and automation by explicit user eligibility, account controls, and product maturity.
- Migration and schema hygiene: resolve duplicate numbering ambiguity, maintain a canonical ledger, and verify applied production migrations.

Metrics that matter

Category	Examples
Decision quality	Stand-down rate by regime; risk-adjusted outcomes; target/stop behavior; model-version comparisons; data freshness exceptions.
User safety	Cap-trigger frequency; skipped/declined actions; suitability completion; order-review edits; error/support patterns.
Product value	Activation to first understood Trade Map; retention; journal completion; paper-to-planning conversion; learning-module progress.
Reliability	Scan latency, data/provider failures, rate-limit events, stale-data rejection, deploy rollback rate, database/job health.
Acquisition readiness	Code/IP chain of title, provider licenses, evidence registry completeness, security posture, architecture/runbook currency, recurring revenue and retention evidence.

Governance cadence

- Weekly: review production health, data freshness, user-impacting errors, and unresolved security issues.
- Per release: Creation Gate, test evidence, terminology/IP check, migration review, owner, monitoring, and rollback plan.
- Monthly: model/evidence review, roadmap prioritization, product-safety review, and durable-asset ledger update.
- Quarterly: acquisition readiness review covering IP ownership, architecture docs, provider dependencies, security, evidence, and commercial metrics.

Public positioning guardrails

Use GSPS — Guided Stock Projection System, with language such as Market Outlook, Entry Zone, First Target, Final Target, Risk Level, Pivot Plan, and Setup Strength. Maintain the required educational/informational disclosure. Do not publicly expose internal methods, formulas, roots, nodes, vectors, or other proprietary calculation terminology.

North-star outcome

Build GSPS into a transferable decision-intelligence platform whose product behavior, code architecture, evidence trail, and governance are coherent enough to withstand user scrutiny, technical diligence, and acquisition review.
