

Replay Harness Test Results

GSPS Trading Strategy Backtest

Test Date: August 08, 2026

Executive Summary

This document presents the comprehensive results from a replay harness test of the GSPS trading strategy. The replay harness executes the strategy against historical bar data to measure win rate, expectancy, and other key performance metrics in a controlled, pessimistic environment that accounts for realistic friction and slippage.

Key Metrics Summary

Metric	Value
Win Rate	29%
Total Trades	[Enter value]
Wins	[Enter value]
Losses	[Enter value]
Timeouts	[Enter value]
Ambiguous Trades	[Enter value]
Expectancy (R)	[Enter value]
Total R	[Enter value]
Armed Setups	[Enter value]
Triggered Trades	[Enter value]

Trade Breakdown by Output State

The scanner assigns each setup a verdict based on confluence scoring: Execute (high confidence), Watch (medium confidence), Reject (low confidence), or Unscored (insufficient daily history).

Output State	Trades	Win Rate	Expectancy	Total R
Execute	[Enter]	[Enter]	[Enter]	[Enter]

Watch	[Enter]	[Enter]	[Enter]	[Enter]
Reject	[Enter]	[Enter]	[Enter]	[Enter]
Unscored	[Enter]	[Enter]	[Enter]	[Enter]

Analysis & Interpretation

Understanding the 29% Win Rate

A 29% win rate means that the strategy wins approximately 29% of executed trades. This can still represent a profitable system if the average winning trade is significantly larger than the average losing trade. The key metric to evaluate profitability is expectancy (measured in R multiples), not win rate alone.

Key Considerations

- Risk-Reward Ratio:** Positive expectancy can be achieved with win rates below 50% if average wins exceed average losses
- Timeframe:** Shorter timeframes typically show lower win rates than longer timeframes
- Market Regime:** Win rate varies by trend/range conditions; this is portfolio-level average
- Ambiguous Trades:** Bar-level ambiguity is resolved pessimistically (assumed loss when both stop and target touched same bar)
- Friction:** Results include realistic transaction costs and slippage charges

Using This Baseline for Future Comparison

This 29% win rate serves as your baseline for evaluating strategy improvements. When running future replay harness tests, track:

- Win Rate Changes:** Improvements indicate better pattern detection or setup quality
- Expectancy Changes:** Reflects combined impact of win rate and risk-reward optimization
- Armed/Triggered Ratio:** Shows how selective the pattern detection has become
- Output State Distribution:** Reveals which scoring thresholds are most predictive

Test Parameters

- Date Range Tested:** [Enter dates]
- Symbols/Universes:** [Enter symbols]
- Timeframe:** [Enter timeframe]
- Target R Multiple:** [Enter R value]
- Transaction Cost per Share:** [Enter cost]
- Warmup Period (bars):** [Enter bars]
- Max Bars Held:** [Enter bars]
- Notes:** [Add any relevant observations]
