

GPS Product Constitution

GPS Implementation Specification Pack • Prepared for Claude Code • August 28, 2026 • Draft implementation directives; requires securities/compliance counsel review before live personalized recommendations or execution.

Purpose and operating boundary

GPS is a market-scanning, education, and structured trade-plan platform. Its central purpose is to identify objectively defined, confirmed opportunities—especially a confirmed pullback inside an established trend—while teaching users why a setup did or did not qualify.

Launch posture: decision support and paper-trading/trade-plan-first. Do not implement autonomous execution, profit guarantees, or language stating that GPS “knows” a trade will be profitable. User-facing wording must describe rules alignment, historical context, invalidation, and risk—not certainty.

- GPS removes unstructured decision-making; it does not remove user agency.
- A user must always be able to decline an entry, reduce size, cancel an unfilled order, or reduce/close risk.
- No tier upgrade, payment event, or feature entitlement may bypass an active safety cooldown, critical lock, or emergency risk restriction.
- All rules must be versioned, deterministic, testable, and auditable.

Tier architecture

Tier	Primary access	Trading scope	Setup/scanning entitlement
Novice	Guided learning	Long-only cash-equity/ETF swing plans; no discretionary intraday trading at launch	6 setups per scan, ideally 3 long / 3 short watch contexts; 1 manual dashboard scan/day plus automated preparation
Pro	Expanded guided access	Swing plus controlled intraday only after suitability/readiness workflow	12 setups per scan; 3 manual scans/day
Expert	Advanced analysis	Multi-timeframe swing/intraday; advanced validated modules	20 setups per scan; 6 manual scans/day
Wall Street	Full research access	Full qualified universe and advanced analytics; never bypasses risk locks	30 setups per scan; unlimited scans

Tier access is a feature and education progression—not a claim that higher tiers produce profits. Promotion eligibility must emphasize process discipline and demonstrated understanding, not a lucky profit streak.

Non-negotiable safety principles

- “No qualified setup” is a valid and desirable scanner result.
- Novice must remain swing-only. Intraday data may refine a swing entry, but cannot create a same-day trading thesis for Novice.
- All candidate signals require an entry trigger, invalidation/stop coordinate, target path, expiry rule, and explicit disqualifiers.
- Protective actions are never blocked: exits, reductions, stop orders, profit-taking, and cancellation of pending entries remain available.
- Market data freshness, liquidity, corporate events, and account-state checks are required before a setup is eligible.
- Use public, independently designed methods. Do not copy, retain, infer, or recreate confidential third-party indicator logic.

Terms Claude Code must use consistently

Term	Definition
Eligible universe	Securities that pass market-cap, liquidity, price/fractional eligibility, event-risk, spread, and data-quality filters.
Qualified setup	Eligible instrument plus a valid regime, deterministic confirmation, viable target path, and account-risk pass.
Rules Alignment Score	A transparent score representing current criteria satisfied; it is not a forecast probability.
Planned risk	Entry-to-stop distance multiplied by position quantity, including only the intended initial risk.
Master Profit	Final predefined profit coordinate. After qualification, it becomes the minimum protected floor for a runner subject to execution rules.
Cooldown	Temporary block on new entries only. It does not block risk-reducing actions.
Risk lock	More serious state that blocks new positions for a defined period and requires a reset workflow.
