

GSPS Signal and Regime Engine

GSPS Implementation Specification Pack • Prepared for Claude Code • August 28, 2026 • Draft implementation directives; requires securities/compliance counsel review before live personalized recommendations or execution.

Signal-engine mandate

Implement four distinct scanner states. Do not combine them into a single “buy/sell” indicator. Each state has a unique regime definition, entry logic, stop logic, target logic, disqualifiers, and expiry.

State	Purpose	Novice availability
Trend Pullback	Enter a controlled retracement that resumes in a confirmed trend	Primary Novice setup
Trend Breakout	Enter accepted expansion from a validated base/compression	Secondary; only after validation
Confirmed Reversal	Enter only after exhaustion at a meaningful location becomes a structural shift	High threshold / limited Novice use
Range Reversion	Buy support / sell resistance in verified rotational conditions	Secondary; no midpoint entries

Regime classifier

Use independently designed public components such as moving-average slope/alignment, price structure, ATR-based volatility state, ADX/DMI, anchored VWAP, volume behavior, and horizontal support/resistance. Treat any trend overlay—PSAR or Supertrend—as optional evidence, never as a sole trade signal.

Regime	Required characteristics	Disqualifiers
Trend	Clear higher highs/higher lows or lower highs/lower lows; MA slope/alignment; trend-strength support	Repeated trend-overlay flips, flat/crossing MAs, no directional structure
Range	Low/weak trend strength; flat MAs; repeatable horizontal boundaries; rotational price action	Accepted breakout with rising volatility/volume
Transition	Exhaustion at meaningful level plus structural break/reclaim	Divergence or indicator flip without price confirmation
Event/high uncertainty	Scheduled binary event, stale data, abnormal spread, extreme gap risk	No Novice new entry

Confirmed bullish pullback: v1 deterministic specification

- Instrument is in the eligible universe and passes all account/state gates.
- Higher-timeframe trend is bullish: configured fast MA is above slow MA; slopes are positive; price remains above the valid structural higher low.
- Pullback reaches an approved location: rising fast/slow MA, anchored VWAP, prior breakout/retest zone, or defined support area.
- Pullback remains orderly: no decisive structural close below the designated higher low; abnormal countertrend expansion disqualifies the setup.
- A confirmation close occurs: e.g., close above the prior candle high, reclaim of approved MA/AVWAP, or break of the micro pullback trendline/swing high.
- Liquidity, spread, market benchmark/sector context, event-risk, target-room, and account risk all pass.
- Signal expires after a configured number of completed operating-timeframe bars if entry is not triggered.

Scoring and no-prediction controls

Component	Suggested points	Implementation note
Higher-timeframe direction	15	Use closed candles only; no look-ahead.
Approved pullback location	15	Price must touch/reclaim a defined zone.
Structural integrity	15	Defined higher low must remain valid.
Confirmation close	15	Do not score intrabar as confirmed.
Liquidity/spread pass	10	Block if execution cost is excessive.
Benchmark/sector alignment	10	Use correlation/market context.
Volume/resumption evidence	10	Optional only where reliable data exists.
No binary event conflict	5	Unknown event data defaults to caution/block.
Target and stop feasibility	5	Must satisfy tier-specific rules.

Rules Alignment Score is 0–100. Below 75: watchlist only. 75–84: qualified only if all safety gates pass. 85–91: A-tier. 92–100: A+ rules alignment. Never render these as a probability of profit.

Required disqualifiers

- Unclosed operating-timeframe candle or stale market data.
- Earnings or defined binary event inside the expected hold period for Novice.
- Target blocked by credible resistance before the minimum required reward path.
- Stop required beyond the Novice maximum policy or position size unavailable within buying-power/allocation limits.
- Correlation/concentration, cooldown, or total-open-risk failure.
- Signal generated from non-adjusted/incorrect data or during unsupported session condition.
