

Guided Stock Precision Scanner

First-Time User Guide

A plain-English public guide to exploring the GSPS workspace, reviewing displayed market information, and maintaining a disciplined personal process.

What this guide covers: How to navigate GSPS, choose a ticker and timeframe, review the information displayed in the workspace, and document your own decision process.

What this guide does not cover: The protected internal methods, calculations, classifications, model design, or other proprietary processes used to produce GSPS outputs.

Educational information only. GSPS is a market-analysis workspace. It does not provide personalized investment advice, execute trades, or guarantee future outcomes. Market prices can change rapidly, and trading can result in loss.

1. Start Here

GSPS helps you organize market information in one place. You can review selected securities, choose a chart timeframe, view the system's user-facing assessment, and record a disciplined plan before making any independent decision.

Use GSPS as one input in your own research process. Do not treat a displayed label, level, chart, alert, or scan result as an instruction to buy, sell, hold, or trade.

Your first goal is simple: learn the workflow before putting capital at risk.

2. Know the Workspace

Workspace area	What it means	What you do
Ticker search	A search field for a security symbol, such as a stock or exchange-traded fund symbol.	Enter the symbol you want to review and verify that the name shown is the correct security.
Market scanner	A view that helps you review groups of actively moving or otherwise selected securities.	Use it to identify securities worth researching further.
Watchlist	A saved group of securities you want to monitor repeatedly.	Create or select a list that matches your own research interests.
Timeframe selector	A control for the chart interval, such as 15 minutes, 1 hour, or 1 day.	Choose the interval that matches the time horizon you are personally evaluating.
Chart	A visual display of recent and historical market price activity.	Review price behavior, volatility, and context rather than relying on a single number.
Analysis panel	The part of GSPS that presents its user-facing observations and planning references.	Read the displayed information, then compare it with your own criteria and research.
Notes or saved analysis	A place to record why an item caught your attention and what you intend to monitor.	Document your independent reasoning before taking any action.

3. Run Your First Review

1. Open GSPS. Start on the GSPS dashboard. Check whether the market is open, closed, pre-market, or after-hours. Conditions and available price information may differ by session.

2. Choose what to review. Select a market-scanner category, a saved watchlist, or a single ticker. Begin with a liquid, familiar symbol so you can focus on learning the interface.

3. Confirm the instrument. Make sure the symbol, company or fund name, and exchange shown are what you intended. Similar symbols can represent different securities.

4. Select a timeframe. Pick one timeframe that fits the period you want to study. Do not switch timeframes simply to find an answer you prefer.

- 5. Review the chart context.** Look at recent price movement, range, volume information if displayed, and major news or events you already know about. A chart is context, not certainty.
- 6. Run or refresh the analysis.** Use the relevant GSPS control to view the current user-facing assessment and planning references.
- 7. Read before acting.** First understand every displayed field. If you cannot explain it in your own words, do not act on it.
- 8. Save notes.** Record the date, ticker, timeframe, what you observed, and what would change your view.

4. Choose a Timeframe

A timeframe changes the amount of price activity visible in each chart interval. It does not make a market outcome more certain. Choose it based on the period you intend to research and monitor.

Example timeframe	Typical use	Beginner reminder
15-minute	Reviewing short-term market activity during the trading day.	Information can change quickly. Only use this view if you can actively monitor your process.
1-hour	Reviewing a broader intraday or short-term view.	This may be easier to follow than very short intervals, but it still carries market risk.
Daily	Reviewing multi-day price behavior and broader context.	Do not expect a daily view to resolve within minutes or hours.

Simple rule: decide your intended research horizon first. Then use the timeframe that best fits that horizon.

5. Read the Displayed Information

GSPS may show a market-direction assessment, chart context, reference zones, planning levels, alerts, or other user-facing observations. These are analytical displays designed to help you organize a review; they are not individualized recommendations.

Displayed item	Plain-English meaning	Responsible response
Market assessment	A current system view of market conditions or directional context.	Use it as a prompt to investigate further, not as an automatic trading instruction.
Reference zone	A price area flagged for your review in the GSPS interface.	Review price behavior and your own criteria around that area.
Planning level	A displayed price reference that may help you organize entry, review, or risk discussions.	Decide independently whether it is relevant, then document your own plan.
Alert or status	A notification that selected conditions may warrant a new review.	Recheck the chart, current market conditions, and your notes. An alert is not a trade order.
Neutral or no clear setup	The system is not presenting a direction you consider actionable under your criteria.	Wait. Choosing not to act is a valid outcome.

6. Build Your Own Plan

Before you make any investment decision, create a personal plan in writing. GSPS can help you organize information, but you remain responsible for your decision, the amount at risk, and any order you place through a broker.

1. **What am I reviewing?** Record the ticker, company or fund name, date, market session, and timeframe.
2. **Why is it on my list?** Write the specific market information, news, technical context, or other research that caused you to review it.
3. **What would I need to see?** State the condition that would cause you to consider entering, rather than using vague language such as “if it looks good.”
4. **What would make my idea wrong?** Define the market condition or price level at which you would reassess or exit. Consider that actual fills may differ from a target price in fast markets.
5. **What is my maximum risk?** Determine the maximum dollar amount or percentage of capital you are willing to lose before acting.
6. **Where will I reassess?** Identify one or more areas where you will review the position, reduce exposure, take gains, or close it, based on your personal rules.
7. **How will I monitor it?** Decide whether you can realistically monitor the position at the chosen timeframe.
8. **What if nothing happens?** Specify that you will take no action if your independent criteria are not met.

Use the same written process for every idea. Consistency makes it easier to evaluate your decisions later.

7. If Conditions Change

Market conditions can change quickly. Do not react impulsively to a single move, alert, headline, or displayed assessment. Use a defined reassessment process.

Situation	What to do
Your personal entry criteria are not met.	Take no action. Continue monitoring only if it remains on your research list.
You entered a position and your invalidation condition occurs.	Follow the risk controls and exit/reassessment rules you established before entry. Do not change a rule merely to avoid accepting a loss.
The market moves opposite your original view.	Close or reassess the original idea under your plan. A move in the opposite direction is not a reason to immediately reverse a position.
You now see an opposite-direction opportunity.	Treat it as a separate, new idea. Complete a fresh review, define fresh criteria, and set new risk controls before considering it.
The system is neutral or information is unclear.	Wait. You do not need to be in a trade to use GSPS productively.

A disciplined process separates reassessment from reaction. Close or reassess the first idea before considering any new idea.

8. Example Workflow

This fictional example shows how to use GSPS without relying on undisclosed system methods or treating the platform as a source of individualized advice.

Step	Example action
1. Select	You search for a familiar ticker and choose the 1-hour timeframe because you want to review a broader intraday view.
2. Review	You view the chart and the user-facing GSPS assessment. You also check the current market session and any information relevant to your own research.
3. Document	You write what you observed, the condition that would justify further consideration, and the risk level that would invalidate your personal idea.
4. Wait	The condition does not occur. You take no action and save your note for later review.
5. Reassess	At a later time, you refresh the workspace and repeat your process. If your criteria remain unmet, you continue to wait or remove the item from your list.

The lesson: GSPS can be useful even when you do not trade. Recording observations, waiting for your own criteria, and avoiding forced decisions are part of responsible use.

9. First-Time Checklist

- I confirmed the correct ticker and market session.
- I selected a timeframe that matches the period I intend to study.
- I reviewed the chart and current information rather than relying on one displayed item.
- I understand each field I am using in the GSPS interface.
- I have written my own reason for monitoring or considering the security.
- I identified a condition that would cause me to do nothing.
- I defined my maximum acceptable risk before making any decision.
- I have a written reassessment or exit rule if the market moves against my view.
- I understand that displayed information is not personalized investment advice or a guarantee.
- I will record the outcome so I can evaluate my process later.

10. Public Product Terms

The following GSPS names, methods, calculations, data transformations, classifications, scoring, thresholds, labels, mappings, model behavior, source code, documentation, research, testing, and implementation details may be proprietary or confidential. This guide intentionally does not explain or disclose them.

Do not attempt to reverse engineer, reproduce, scrape, redistribute, or create derivative products from protected GSPS content or functionality. Your use of GSPS remains subject to the applicable Terms of Use, Privacy Policy, and any other agreement presented by the service.

Final reminder: information in GSPS is for education, research, and workflow support. You are solely responsible for your investment decisions, broker orders, tax consequences, and risk management.
